

# WASH YOUR PROBLEM

## SET STAINS

### 1-ITEM AFFECTED

Workwear

### 2-CAUSE

Washing workwear with inappropriate detergent or improper process.  
Protein stains not removed and are denatured or set into fabric.

### 3-SOLUTION

Rewashing with a standard process will be pointless. A recovery process is required using Prime, followed by the use of Oxalic acid to remove iron that is a component of blood residues.

Follow this with a short wash, using a detergent to remove any residues of Oxalic acid (poisonous).
